Nimba Money — Operations Guide

Investor prototype · Next.js 14 · frontend-only, deterministic mock data

P2P Exchange (green) | Marketplace (blue) | Guinea · GNF ↔ USDT

! Site shows “This deployment is temporarily paused”

This is a **Vercel account/project limit**, not a code bug (the app builds and all 41 routes return 200 locally). Fix: open Vercel → Project → Settings / Usage and resume or upgrade — **or** re-host in 5 min using the options below.

1 Re-host on Vercel (new project)

- `vercel.com/new` → Import `molotroka123-cell/nimbamoney`
- Framework: **Next.js** (auto) · no env vars required
- Deploy → open the new `*.vercel.app` URL
- Optional: `NEXT_PUBLIC_SITE_URL` = your final domain (link previews)

2 Re-host on Netlify (backup)

- `app.netlify.com` → Add site → Import from GitHub
- Repo has `netlify.toml` ready (Next.js plugin)
- Build `npm run build` · publish `.next`
- Free plan is enough for a demo

3 Run locally / on a laptop

```
npm install
npm run dev      # http://localhost:3000
npm run build && npm start
```

Node 18.18+ required. Share from a laptop with any tunnel (e.g. `cloudflared tunnel --url localhost:3000`).

4 Manage content

Change	File
Traders, offers, orders	`data/mock/p2p.ts`
Providers & reviews	`data/mock/providers.ts`
Rates, limits, branding	`config/product.ts`
FR / EN texts	`lib/i18n.tsx`

5 Investor demo — 2 minute script

Flow	Steps
P2P `/p2p`	Open P2P → 10 M GNF → choose **Kaba Trade** → order room → pay → “J’ai payé” → USDT released → receipt
Marketplace `/marketplace`	Compare **Kaba Trade** vs **Tymur MrSwap** → profile → verification & liquidity → request liquidity → live timeline
Extras	`/marketplace/map` cash points · `/marketplace/diaspora` transfers · `/kyc` levels · `/admin` & `/partner` back-offices · `/?tour=1` guided tour

6 Before the meeting

- Open the link on phone **and** laptop 10 min earlier
- Keep a local `npm start` as a fallback
- Use a private tab: state is stored in the browser
- All data is mock — no real funds or claims

7 Update & troubleshoot

- Push to the deployed branch → auto redeploy
- Blank/old page: hard refresh, check Deployments log
- Check code: `npm run typecheck`, `npm run build`
- Legacy URLs `/find`, `/providers` redirect automatically
